

Target Greens

STI target greens can quickly be installed at a low cost to the driving range and even be placed over existing greens. No maintenance required after the installation and the ball will react naturally without being marked up. Target greens are perforated for drainage and ball pickers can drive directly over the greens. STI provides four (4) different colors of target turf to emulate fairways, water hazards, bunkers, and greens.

Installation

Target turf can either sewn or seamed together. The seaming process is not nearly as critical as a putting green because it is being covered with sand. Once the green is shaped and seamed then it is filled with sand in multiple layers exposing only a half an inch. The turf will take approximately 4-5 pounds of sand per sq. ft. If there are any other colors of range turf along the target greens there are to be seamed before any sand is applied. The final step is to nail (6" screw nails) the outside edge every 6"-12" depending on the curve.
